

# Aspect Separated from Aspectual Markers in Russian and Czech

Petr Biskup

This article is concerned with the derivation of morphological aspect in Russian and Czech. It investigates four aspectual markers: prefixes, the secondary imperfective suffix, the semelfactive marker and the habitual suffix. It argues that not only in Russian (see Tatevosov 2011, 2015) but also in Czech aspect interpretation is separated from prefixes and the secondary imperfective suffix. Moreover, it extends the separation to the semelfactive suffix and the habitual marker. Specific morphological aspect properties of Russian and Czech predicates are derived by an Agree analysis with minimality based on dominance relations in the complex verbal head.

**Keywords:** Agree, aspect, prefixes, secondary imperfective, semelfactive suffix, habitual suffix

## 1 Aspectual markers

This section introduces four aspectual markers, prefixes, the secondary imperfective marker, the semelfactive suffix and the habitual suffix. I call these morphemes aspectual markers since they are relevant to morphological aspect (they can change the perfective/imperfective value of the base predicate) and/or since they are relevant to aspect more generally, e.g. because of bringing about (a)telicity, habituality or new aktionsart properties.

### 1.1 Prefixes

Lexical prefixes (also called internal, qualifying, resultative) as well as superlexical (external, modifying, aktionsart) prefixes almost always perfectivize the imperfective simplex verb (for discussion of the two types of prefixes, see e.g. Isačenko 1962, Petr 1986, Lehmann 1993, Schoorlemmer 1995, Babko-Malaya 1999, Svenonius 2004, Arsenijević 2006, Romanova 2006, Gehrke 2008, Tatevosov 2013, Szucsich 2014, Biskup & Zybatow 2015, Čaha & Ziková 2016, Biskup 2019, Klimek-Jankowska & Błaszczak 2021a,b). For the perfectivizing effect of lexical prefixes, see (1) and (2) and for the effect of superlexical prefixes, consider examples (3) and (4).<sup>1</sup>

- |        |  |    |  |           |
|--------|--|----|--|-----------|
| (1) a. | kleit <sup>IPF</sup><br>stick<br>'to stick on'   | b. | [na-[kleit <sup>IPF</sup> ] <sup>PF</sup> ]<br>on-stick<br>'to stick on' | (Russian) |
| (2) a. | chovat <sup>IPF</sup><br>out-raise<br>'to raise' | b. | [vy-[chovat <sup>IPF</sup> ] <sup>PF</sup> ]<br>out-raise<br>'to raise'  | (Czech)   |

---

<sup>1</sup> Lexical prefixes are glossed with a meaning of the corresponding preposition and superlexical prefixes are glossed with the appropriate aktionsart abbreviation. The following abbreviations are used: ACC=accusative, ATT=attenuative, COMP=completive, CUM=cumulative, DA=degree achievement, DEL=delimitative, DIST=distributive, EXC=excessive, HAB=habitual, INC=inceptive, INF=infinitive, IPF=imperfective, LP=lexical prefix, NMLZ=nominalizing affix, NOM=nominative, PART=participle, PF=perfective, REP=repetitive, SEML=semelfactive, SI=secondary imperfective, SP=superlexical prefix, TH=theme (vowel).

(3) a. delat<sup>IPF</sup>  
do  
'to do'

b. [na-[delat'<sup>IPF</sup>]<sup>PF</sup>]PF (Russian)  
CUM-do  
'to do a lot'

(4) a. plést<sup>IPF</sup>  
knit  
'to knit'

b. [do-[plést'<sup>IPF</sup>]<sup>PF</sup>]PF (Czech)  
COMP-knit  
'to complete knitting'

Both Russian and Czech also have simplex verbs that are perfective. If they combine with a lexical or a superlexical prefix, they remain perfective, as demonstrated by the Russian examples in (5) and the Czech examples in (6).

(5) a. [vy-[kupit'<sup>PF</sup>]<sup>PF</sup>]  
out-buy  
'to buy sb.'s freedom'

b. [na-[kupit'<sup>PF</sup>]<sup>PF</sup>]PF (Russian)  
CUM-buy  
'to buy a lot'

(6) a. [do-[dat]<sup>PF</sup>]<sup>PF</sup>  
to-give  
'to deliver'

b. [do-[říci]<sup>PF</sup>]<sup>PF</sup> (Czech)  
COMP-say  
'to say to the end'

Lexical and superlexical prefixes can co-occur, as shown by the following examples. Also in this case, the predicate remains perfective. In addition, it holds that the superlexical prefix must occur outside the lexical prefix, as demonstrated by the contrast between (a) examples and (b) examples.

(7) a. [pere-[vy-polnit'<sup>PF</sup>]<sup>PF</sup>]  
EXC-out-fulfill  
'to overfulfill'

b. \*[vy-[pere-polnit'<sup>PF</sup>]<sup>PF</sup>]PF (Russian)  
out-EXC-fulfill

(8) a. [pře-[vy-chovat]<sup>PF</sup>]<sup>PF</sup>  
REP-out-raise  
'to re-educate'

b. \*[vy-[pře-chovat]<sup>PF</sup>]<sup>PF</sup> (Czech)  
out-REP-raise

## 1.2 The secondary imperfective marker

In this section, I consider the effect of the secondary imperfective suffix on the morphological aspect of the base predicate. Let us begin with Russian.

The secondary imperfective suffix derives an imperfective predicate from a perfective predicate, which can contain a lexical prefix, as in (9) and (10), or a superlexical prefix, as in (11). It can also derive an imperfective predicate from a perfective verb without a prefix, as shown in (12).

(9) a. [za-[rabot-a]<sup>IPF</sup>]<sup>PF</sup>-t'  
behind-work-TH-INF  
'to earn'

b. [[za-[rabat]<sup>IPF</sup>]<sup>PF</sup>-yva]<sup>IPF</sup>-t' (Russian)  
behind-work-TH-INF  
'to earn'

(10) a. [po-[moč']<sup>IPF</sup>]<sup>PF</sup>  
along-can  
'to help'

b. [[po-[mag]<sup>IPF</sup>]<sup>PF</sup>-a]<sup>IPF</sup>-t' (Russian)  
along-can-SI-INF  
'to help'

(11) a. [za-[rabot-a]<sup>IPF</sup>]<sup>PF</sup>-t'                      b. [[za-[rabat]<sup>IPF</sup>]<sup>PF</sup>-yva]<sup>IPF</sup>-t'      (Russian)  
 INC-work-TH-INF                      INC-work-TH-INF  
 'to start working'                      'to start working'

(12) a. [d-a]<sup>PF</sup>-t'                                      b. [[d-a]<sup>PF</sup>-va]<sup>IPF</sup>-t'                      (Russian)  
 give-TH-INF                                      give-TH-SI-INF  
 'to give'    'to give'

Certain superlexical prefixes can also attach outside the imperfectivizing suffix (see e.g. Ramchand 2004, Gehrke 2008, Szucsich 2014, Tatevosov 2013, Klimek-Jankowska & Błaszczak 2021a,b) and they perfectivize the predicate again, as illustrated in example (13).

(13) a. [[vy-[talk]<sup>IPF</sup>]<sup>PF</sup>-iva]<sup>IPF</sup>-t'                      b. [po-[[vy-[talk]<sup>IPF</sup>]<sup>PF</sup>-iva]<sup>IPF</sup>]<sup>PF</sup>-t' (Russian)  
 out-push-SI-INF                      DIST-out-push-SI-INF  
 'to push out'                                      'to push out one after another'

Some superlexical prefixes can occur both inside the imperfectivizing suffix, as the inceptive *za-* in (11), and outside the secondary imperfective marker, as the inceptive *za-* in the following example.

(14) a. [[ot-[kry]<sup>IPF</sup>]<sup>PF</sup>-va]<sup>IPF</sup>-t'                      b. [za-[[ot-[kry]<sup>IPF</sup>]<sup>PF</sup>-va]<sup>IPF</sup>]<sup>PF</sup>-t' (Russian)  
 away-cover-SI-INF                      INC-away-cover-SI-INF  
 'to open'    'to start opening'

Standardly, the secondary imperfective suffix is taken to have three forms: *-yva/-iva-*, as in (9b), (11b) and (13), *-va-*, as in (12b) and (14), and *-a/-ja-*, as in (10b); see e.g. Vinogradov *et al.* (1952), but there are also alternative analyses like Isačenko (1962) and Matushansky (2009). A closer look at the data under discussion reveals that *v* is present in *-va-* because of blocking hiatus; compare examples (12) and (14) with example (10b).

In Czech, an analogous pattern is observed. Also in this case, the secondary imperfective suffix derives an imperfective verb from a perfective verb and the base predicate can contain either a lexical prefix or a superlexical prefix. Examples (15b) and (16b) show an imperfective predicate derived from a lexically prefixed verb and example (17b) shows an imperfective predicate derived from a superlexically prefixed predicate.

(15) a. [za-bí]<sup>PF</sup>-t                      b. [za-bí]<sup>PF</sup>-je]<sup>IPF</sup>-t                      (Czech)  
 behind-beat-INF                      behind-beat-SI-INF  
 'to kill'    'to kill'

(16) a. [vy-pros-i]<sup>PF</sup>-t                      b. [vy-proš]<sup>PF</sup>-ova]<sup>IPF</sup>-t                      (Czech)  
 out-beg-TH-INF                      out-beg-SI-INF  
 'to beg'    'to beg'

(17) a. [do-plés]<sup>PF</sup>-t                      b. [[do-plét]<sup>PF</sup>-a]<sup>IPF</sup>-t                      (Czech)  
 COMP-knit-INF                      COMP-knit-SI-INF  
 'to complete knitting'                      'to complete knitting'

The imperfectivizing suffix can also derive an imperfective predicate from an unprefixated perfective verb, as illustrated in examples (18) and (19).

and derives a perfective stem, as illustrated in the Russian example (23) and the Czech example (24).<sup>3</sup>

- |         |                          |    |   |           |
|---------|--------------------------|----|---|-----------|
| (23) a. | krik<br>shout<br>'shout' | b. | krik-nu-t <sup>PF</sup><br>shout-SEML-INF<br>'to shout out' | (Russian) |
| (24) a. | bod<br>point<br>'point'  | b. | bod-nou-t <sup>PF</sup><br>point-SEML-INF<br>'to stab'      | (Czech)   |

The semelfactive marker differs from the suffix *-n(V)-* present in other verbs like degree achievements. The degree achievement *-n(V)-* selects a root denoting a property and does not have a perfectivizing effect on the verb (see Taraldsen Medová & Wiland 2019 for the relation and differences between the two *-n(V)-* suffixes).

Since the semelfactive suffix attaches directly to the root and verbalizes it, as shown by the contrasts in (23) and (24), I assume that it spells out the verbalizing head *v*. If correct, then we expect the semelfactive suffix to be in complementary distribution with other themes representing the verbalizing *v*. This prediction is borne out, as demonstrated below. The (a) examples show a grammatical combination of the root and a theme vowel, whereas the (b) examples – based on grammatical forms (23b) and (24b) – demonstrate that the co-occurrence of the theme vowel and the semelfactive suffix leads to ungrammaticality in both orders.

- |         |   |    |   |   |                                     |           |
|---------|---|----|---|---|-------------------------------------|-----------|
| (25) a. | krič-a-t'<br>shout-TH-INF<br>'to shout' | b. | * krik-nu-va-t' <sup>4</sup><br>shout-SEML-TH-INF | / | * krič-a-nu-t'<br>shout-TH-SEML-INF | (Russian) |
| (26) a. | bod-a-t<br>point-TH-INF<br>'to stab'    | b. | * bod-a-nou-t<br>point-TH-SEML-INF                | / | * bod-nou-va-t<br>point-SEML-TH-INF | (Czech)   |

Given that the semelfactive marker represents the verbalizing head *v*, the complementary distribution of this suffix and the secondary imperfective marker – shown in (27) and (28) – cannot be based on structural blocking, as proposed e.g. by Markman (2018) for Russian.

- |      |                   |           |
|------|-------------------|-----------|
| (27) | * krik-nu-va-t'   | (Russian) |
|      | shout-SEML-SI-INF |           |
| (28) | * bod-nou-va-t    | (Czech)   |
|      | point-SEML-SI-INF |           |

The reason for ungrammaticality of cases like (27) and (28) can be rather semantic. For instance, Jabłońska (2007) argues that semelfactives – being instantaneous – do not have a process part in their event structure, on which the progressive operator of secondary imperfectives could operate. Another possibility is to assume that the secondary imperfective suffix spells out an atelicizer/eventizer, which combines with complex events, i.e. accomplishments ( $\lambda R.\lambda e.\exists s[R(e)(s)]$ , see Łazorczyk 2010 and Tatevosov 2015). It is obvious

<sup>3</sup> Some Russian verbs take the expressive, extended marker *-anu-* (and some both *-nu-* and *-anu-*); see e.g. Isačenko (1962) and Švedova (1980).

<sup>4</sup> To avoid hiatus, I insert /v/ between the semelfactive suffix and the theme vowel, a strategy known from secondary imperfectives.

This can be related to the fact that in contrast to Czech nominalizations, Russian stem nominalizations are structurally less complex and do not contain the aspectual projection, as discussed in the next section.

As illustrated in (23) and (24), the semelfactive suffix perfectivizes the stem, as do prefixes. If both elements co-occur, then unsurprisingly the predicate remains perfective, irrespective of whether the prefix is lexical or superlexical. For a lexical prefix, consider the Russian example in (34) and for a superlexical prefix consider the Czech example (35), with an attenuative reading.

(34) [vs-[krik-nu-t']<sup>PF</sup>]<sup>PF</sup> (Russian)  
 up-shout-SEML-INF  
 'to give a scream'

(35) [na-[prask-nou-t]<sup>PF</sup>]<sup>PF</sup> (Czech)  
 ATT-crack-SEML-INF  
 'to crack partially'

Generally, it is difficult to find examples of semelfactive predicates with a superlexical prefix. This results from the fact that semelfactive predicates refer to bounded singleton events that are punctual, which clashes with the fact that superlexical prefixes typically modify the spatiotemporal path of the event expressed by the base predicate. Moreover, the perfective aspect of semelfactive verbs pose a problem for the imperfective selection properties of some superlexical prefixes.

As the comparison of (36a) and the example (36b) shows, the semelfactive *-n(V)-* is responsible for the ungrammatical status of the verb prefixed by the delimitative prefix *po-*.

(36) a. po-bod-a-t b. \* po-bod-nou-t  
 DEL-point-TH-INF DEL-point-SEML-INF  
 'to stab to a certain extent several times' (Czech)

Because of this, I propose the following meaning for the semelfactive *-n(V)-*.

(37) SEML =  $\lambda P\lambda e[P(e) \ \& \ \text{single-occurrence-of}(e) \ \& \ \text{minimal}(e)]$

It applies to predicates without a change of state and returns a predicate with a single occurrence of the event described by the verb that is minimal. That is, there is no proper part of the event (it is punctual), which means that the predicate is not divisive, which in turn means that it is quantized (see Borer 2005). Because of the minimal (atomic) property of the semelfactive *-n(V)-*, there is no path in the event that could be accessible to the delimitative *po-* in cases like (36b).<sup>6</sup> Note also that the ungrammaticality of (36b) is not based on unsatisfied selectional properties of the delimitative *po-* because this prefix can also adjoin to perfective predicates in Czech, as in  $[[po-[otevřít]^{PF}]^{PF}]$  'to open a little'.

The single occurrence property of the semelfactive *-n(V)-* in (37) is responsible for the fact that the iterative reading is not available in cases like *kriknut'* 'to shout out' and *bodnout* 'to stab' in (23b) and (24b). In contrast, predicates with the same root but without the semelfactive *-n(V)-* like *kričat* 'to shout' and *bodat* 'to stab' in (25a) and (26a) allow the iterative interpretation.<sup>7</sup>

<sup>6</sup> The minimal property is a (language) idealization; in the real world, there can be some trajectory involved e.g. in the stab movement (cf. Rothstein 2004).

<sup>7</sup> The single occurrence property can be defined in terms of a maximality operator; see Egg (2018).

Given the high structural position of the habitual marker, the question arises why it is not compatible with the semelfactive *-n(V)-*, as illustrated in (48) and (49). The answer is not complicated: The habitual suffix selects an imperfective predicate but the semelfactive affix derives perfective verbs.

(48) \* *krik-nu-va-t'* (Russian)  
 shout-SEML-HAB-INF  
 intended: 'shout out repeatedly'

(49) \* *bod-nou-va-t* (Czech)  
 point-SEML-HAB-INF  
 intended: 'stab repeatedly'

In both languages, the habitual suffixes are identical to the secondary imperfective suffixes. Russian mostly uses the marker *-yva-/-iva-*, as in (38), but the markers *-va-* and *-a-/-ja* can also be found; consider verbs in (50) and (51). These examples again suggest that *-va-* and *-a-* are phonologically conditioned allomorphs.

(50) a. *pe-t'*<sup>IPF</sup> b. *pe-va-t'*<sup>IPF</sup> (Russian)  
 sing-INF sing-HAB-INF  
 'to sing' 'to sing repeatedly'

(51) a. *vid-e-t'*<sup>IPF</sup> b. *vid-a-t'*<sup>IPF</sup> (Russian)  
 see-TH-INF see-HAB-INF  
 'to see' 'to see repeatedly'

In Czech, habitual suffixes form a subset of the secondary imperfective markers. Beside *-va-*, there is also its allomorph *-a-*, as in (52), and the marker *-e-*, which is not productive (see Petr 1986).

(52) a. *jís-t'*<sup>IPF</sup> b. *jíd-a-t'*<sup>IPF</sup> (Czech)  
 eat-INF eat-HAB-INF  
 'to eat' 'to eat repeatedly'

In what follows, I argue that – albeit homophonous – the habitual markers are not secondary imperfective suffixes. First, there are morphological aspect differences. While the imperfectivizing suffix derives an imperfective predicate from a *perfective* verb, the habitual suffix derives an imperfective predicate from an *imperfective* base.

There are also interpretational differences. Secondary imperfective verbs can have the progressive interpretation and the iterative/habitual/generic interpretation. In contrast, predicates with the habitual suffix can only have the iterative/habitual/generic interpretation, as demonstrated by the translations in this section. An analogous distinction is observed in cases with iterative adverbs, as in (53). In sentence (53a), two interpretations are available: The first, cardinality interpretation has three iterated events of writing during one vacation. The second one is the habitual quantificational interpretation, which is probably stronger than the habitual interpretation of predicates with the overt habitual marker. In contrast, with the habitual suffix, as in (53b), only the habitual interpretation is available, with *on vacation* going to the restrictor and *he sent a letter three times* to the nucleus of the habitual quantifier ALMOST ALWAYS.

- (67) a. bude bod-a-t<sup>IPF</sup> will point-TH-INF ‘it/(s)he will stab’  
 b. \* bude bod-nou-t<sup>PF</sup> will point-SEML-INF (Czech)

Romanova (2004), Tatevosov (2015) and Mueller-Reichau (2020) argue for Russian that the imperfectivizing suffix merges inside the verbal domain. Thus, the secondary imperfective marker, too, is dissociated from its interpretation because the aspectual head responsible for the imperfective interpretation is located in a higher position above *vP*. According to Biskup (2020), who uses a scope argument similar to the one in Tatevosov (2015), scope facts with the Czech cumulative *na-* also suggest that the position of the imperfectivizing suffix is below the projection with the agentive argument. The same point can be done with the distributive prefix *po-*.

Concretely, cumulative *na-* and distributive *po-* can quantify over an object, as shown by the grammatical plural (non-quantized) object in (68a). The ungrammaticality of the quantized, singular object *jablko* ‘apple’ shows that the prefix *na-* is indeed cumulative and the prefix *po-* distributive. In contrast, the prefixes cannot quantify over an agentive subject, as demonstrated in (68b), where the plural subject is ungrammatical. Only if the object is plural, non-quantized, the sentence is grammatical, as demonstrated in (68c). This is supported by the fact that when we want to quantify over the agentive subject, the argument structure (including case properties) of the verb needs to be manipulated and the reflexive element must be added in the case of the cumulative *na-*, as shown in (68d).<sup>12</sup>

- (68) a. po-/na-s-bír-a-t<sup>PF</sup> jablka / \*jablko  
 DIST/CUM-with-take-SI-INF apples / apple  
 distributive: ‘to pick apples/\*apple one after another’  
 cumulative: ‘to pick amount of apples/\*apple’  
 b.\* Sousedi po-/na-sbírali jablko.  
 neighbors DIST/CUM-picked apple  
 c. Sousedi po-/na-sbírali jablka.  
 neighbors DIST/CUM-picked apples  
 distributive: ‘Neighbors picked apples one after another.’  
 cumulative: ‘Neighbors picked amount of apples.’  
 d. Sousedi se nasbírali jablek do sytosti.  
 neighbors self picked apples.GEN.PL to one’s fill  
 ‘Neighbors had their fill of picking apples.’

Given that the perfective *nasbírat* is derived by attaching the cumulative *na-* and the distributive *po-* to the stem after the secondary imperfective suffix, the example suggests that higher superlexical prefixes like the cumulative *na-* and the distributive *po-* merge below the head introducing the agent and above the imperfectivizing suffix in Czech. Consequently, in the light of the fact that the aspectual projection is above the projection introducing the agent (cf. Babko-Malaya 2003, Filip 2005, Błaszczak & Klimek-Jankowska 2012, Gribanova 2015), it is possible to conclude that the imperfective interpretation is separated from the imperfectivizing suffix.

<sup>12</sup> Compare also the following examples with ‘self’ and the cumulative/saturative *na-*, which is able to quantify over the subject.

- (i) a. na-begat’-sja (Russian) on-run-self ‘to have one’s fill of running’  
 b. na-běhat se (Czech) on-run self ‘to have one’s fill of running’

At the same time, if it is correct that higher superlexical prefixes merge below the projection with the agent (VoiceP), we also have an argument for separating prefixes from the perfective interpretation occurring in the aspectual projection.

The following examples show that stem nominalizations like the Russian *-nie* nominals and the Czech *-ní* nominals can have an agent. The nominals can co-occur with an agent-oriented modifier, as in (69a) and (70a), and can be modified by an agentive *by*-phrase, as shown in (69b) and (70b).

- (69) a. *умышленное преступление* (Russian)  
deliberate delict  
‘a wilful delict’  
b. *совершение преступления лицом...*  
perpetration delict.GEN.SG person.INSTR.SG  
‘a perpetration of the delict by a person’
- (70) a. *úmyslné poškození* (Czech)  
deliberate damage  
‘a malicious damage’  
b. *spáchání trestného činu osobou...*  
perpetration criminal.GEN.SG act.GEN.SG person.INSTR.SG  
‘a perpetration of the delict by a person’

Now let us combine it with the fact that Russian stem nominalizations are aspectless (as discussed in section 1.4). Applying the containment argument again, we come to the conclusion that (at least in Russian) the aspectual projection is indeed above VoiceP, as shown in (71).

- (71) [[[SP<sub>higher</sub> [[SP<sub>lower</sub> [<sub>v</sub> SEML [LP [<sub>v</sub>root<sup>PF/IPF</sup>PF]PF]PF] SI]<sup>IPF</sup>PF Voice] Asp]

Kwapiszewski (2021) argues for the position of the secondary imperfective suffix below Voice and in this way also for separating the imperfectivizing suffix from the morphological aspect in Polish. He builds on Baker & Vinokurova (2009) and draws a parallelism between English nominals in *-er* and Polish agent/instrument *-acz/-arka* nominals. He shows that Polish *-acz/-arka* nominalizations can contain the imperfectivizing suffix but do not embed the Voice projection since they do not allow the relevant modifiers.

The same argument can be done for the Czech counterpart: *-č* nominals (Russian does not have this form of nominals). The animate as well as the inanimate nominal contain the imperfectivizing suffix but do not allow agent-oriented modifiers, as demonstrated in (72).

- (72) a. (\* *úmyslný*) *vy-jedn-a-va-č* (\*, *aby* *zabránil válce*) (Czech)  
deliberate out-one-TH-SI-NMLZ so.that prevent war  
‘a (\*deliberate) negotiator (\*in order to avoid a war)’  
b. *o-vlad-a-č* (\* *osobou*) (\* *s cílem měnit programy*)  
about-rule-SI-NMLZ person.INSTR.SG with goal switch channels  
‘a control (\* by a person), (\* in order to switch channels)’

Thus, in Czech, too, such nominalizations include the projection with the secondary imperfective suffix but are structurally smaller than VoiceP and by transitivity, also smaller than AspP. Beside separating the imperfective suffix from the imperfective interpretation, it also argues for the claim that prefixes are separated from the perfective interpretation in the aspectual projection. Because of the presence of the imperfectivizing suffix, at least lexical

and lower superlexical prefixes are expected to be able to occur in this type of nominalizations. This seems to be correct, given the prefixed examples in (72).

If Baker & Vinokurova (2009) are correct in that agentive nominalizing morphemes like *-er* are nominal versions of the Voice head (having meanings similar to morphemes of Voice heads) that combine with the same complements as Voice does, then the order of the morphemes itself can be taken to mean that the projection of Voice is higher than the projection of the secondary imperfective suffix. The reason is that the imperfectivizing suffix is always closer to the root than the agentive nominalizing morpheme.

It is possible to extend this reasoning to other agent nominalizations, e.g. to nominals ending in *-tel'* in Russian, *-tel* in Czech (and *-ciel* in Polish) and to Russian nominals with the suffixes *-(l')ščik* and *-čik*, which are counterparts of the Czech *-č* discussed above. Such agent nominalizations can contain the imperfectivizing suffix and if that is the case, then the suffix is always closer to the root than the agentive morpheme, independently of whether the nominal is inanimate (instrument), as in (73a), or animate, as in (73b) and (74).

- (73) a. pere-gruž-a-tel'<sup>13</sup> (Russian)  
 over-load-SI-NMLZ  
 'a loader'  
 b. ras-se-va-l'ščik  
 apart-sow-SI-NMLZ  
 'a sorter'

- (74) o-šetř-ova-tel (Czech)  
 about-spare-SI-NMLZ  
 'a keeper'

The consequences for dissociating prefixes and the secondary imperfective suffix from the corresponding morphological aspect interpretation are identical to those in the case of *-acz/-arka* and *-č* nominalizations discussed above.

Since the nominalizations under discussion typically refer to an instrument or an agent repeatedly performing the event expressed by the verb stem (they often contain the imperfectivizing morpheme, as in (72)-(74)), they are incompatible with the semelfactive suffix. Specifically, they are in conflict with the "single-occurrence-of-the-event" property of the semelfactive morpheme (see section 1.3 again).

The next structural prediction is that the nominalizations under discussion cannot include the habitual marker for it is located above the aspectual projection. This prediction seems to be correct since e.g. the Czech National Corpus (Syn8) contains no agent nominalization that have the habitual marker and ends in *-vatel*.

Let us now consider the separation of the morphological aspect interpretation from the habitual marker. The habitual suffix is special. First, in contrast to the other aspectual markers, it occurs above the aspectual projection, as argued in section 1.4. Second, in contrast to the other markers, it cannot reverse the morphological aspect value of the predicate to which it adjoins. Because of the second property, it in actuality does not have to be in a syntactic relation with the aspectual head. It suffices when it imposes the imperfective requirement on its complement. Moreover, given this selection property and the specific quantificational meaning of the marker, the habitual suffix can be treated as semantically independent from the aspectual head, which encodes the inclusiveness relation between the event time and the reference time. Furthermore, since there are forms with the morphological

<sup>13</sup> The underlying theme vowel /i/ brings about the palatalization of the root consonant /z/; compare: *peregruzit'* 'to transfer'.

aspect interpretation that exclude the habitual marker – recall the Czech stem nominalizations from section 1.4 –, I conclude that the habitual marker can be separated from the aspectual phrase as well.

### 3 Deriving the morphological aspect value

As stated in the beginning of the preceding section, the operation Agree is very suitable for cases where a certain interpretation is separated from the element bringing out the interpretational effect. In our case, it is about perfective versus imperfective effects triggered by the four aspectual markers. For this reason, we need an interpretable unvalued aspect feature on the aspectual head and valued features on the aspectual markers. The feature on the aspectual markers (either perfective or imperfective) can value the unvalued feature on Asp and in this way, it can bring about the appropriate inclusiveness relation between the event time and the reference time.

In the current proposal, I follow the Agree analysis by Biskup (2020) and assume that the secondary imperfective marker has an uninterpretable aspect feature with the imperfective value (recall the imperfectivizing effect of this suffix from section 1.2). In contrast, since prefixes perfectivize the base predicate, as we saw in 1.1, they bear an uninterpretable aspect feature with the perfective value. The same also holds for the semelfactive marker because it also have the perfective effect, as discussed in section 1.3. With respect to the habitual marker, I argued in the preceding section that it just has an imperfective selection feature and that it does not have to enter into an Agree relation with the aspectual head. Hence, it bears neither perfective nor imperfective aspect feature.

If we make the standard assumption that lexical prefixes merge in the complement position of the root (Ramchand 2004, Svenonius 2004, Gehrke 2008, Biskup 2019), then the hierarchy with the four aspect markers and their aspect features looks like (75).

(75) [<sub>HabP</sub> HAB [<sub>AspP</sub> Asp<sub>asp-F:[]</sub> [<sub>VoiceP</sub> Voice [<sub>SPP</sub> SP<sub>pf</sub> [<sub>SIP</sub> SI<sub>ipf</sub> [<sub>SPP</sub> SP<sub>pf</sub> [<sub>vP</sub> SEML<sub>pf</sub> [<sub>√P</sub> √ [<sub>PP</sub> LP<sub>pf</sub>]]]]]]]]]]]]

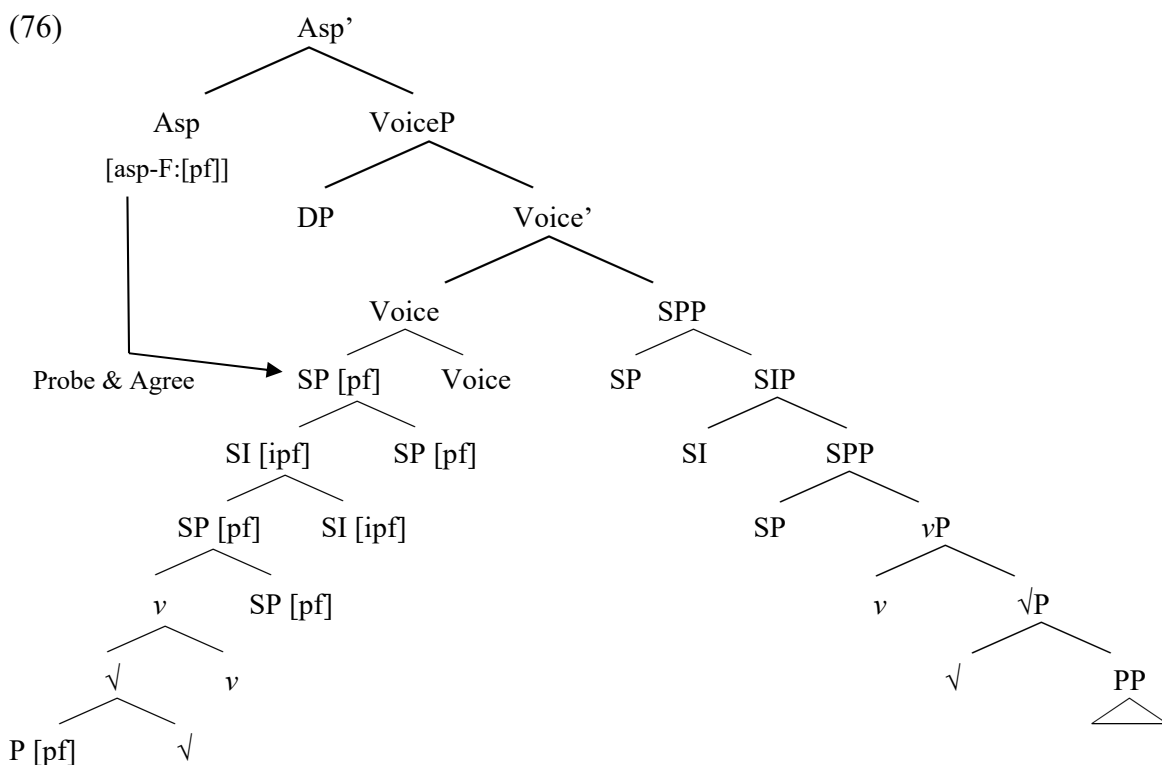

Assuming that morphemes are structurally heads, lexical prefixes head a prepositional phrase, the semelfactive marker heads the vP projection, superlexical prefixes head their own projection SPP and the habitual suffix (without an aspect feature) heads the habitual projection. Superlexical projections can be iterated and occur either lower or higher than the projection of the imperfectivizing morpheme SIP.

The Agree analysis can successfully deal with the generalization MAG, i.e., with the fact that the morphological aspect value is determined by the last attached aspectual morpheme. Specifically, using the standard operation of downward Agree, the last – structurally, the highest – aspectual marker can be determined on the basis of minimality, i.e. the structural distance from the probing aspectual head. The aspect feature of the closest marker will then value the unvalued aspect feature of the aspect head. Since only downward Agree is used, the habitual marker – occurring in a higher structural position – is not visible for the probing aspectual head. This, however, does not pose a problem because the marker cannot change the morphological aspect value, as already discussed above.

If it is correct that the verb moves to the head Asp, as argued by Gribanova (2013, 2015) for Russian, we receive the syntactic structure in (76). Concretely, when the unvalued feature of the aspectual head probes, the complex verbal head is located in Voice. To determine the closeness of aspectual affixes and their features, I employ the concept of dominance. It is the head to which the moving element adjoins that projects, as demonstrated in the abstract structure (76). Since this head dominates the adjoined head, its features (among others, its

valued aspect feature) are closer to the c-commanding aspectual head than the features of the adjoined head.

The complex Voice head in (76) contains the following markers with their aspect features: a lexical prefix (the preposition), a lower superlexical prefix, the secondary imperfective suffix and a higher superlexical prefix. Therefore, the structure can represent predicates like the Russian *po-pere-za-pis-yva-t'* 'to re-record for a while'. The delimitative prefix *po-* merges in the higher superlexical position and the repetitive *pere-* in the lower superlexical position, i.e. below the secondary imperfective suffix *-yva-*. The lexical prefix *za-* is represented by the preposition in (76). What is crucial here, is that the delimitative *po-* projects its perfective feature and dominates the SI constituent headed by *-yva-* with its imperfective aspect feature. Hence, it is the perfective feature of the delimitative *po-* that is the closest aspect feature and values the unvalued aspect feature on Asp. Consequently, the predicate is interpreted as perfective.

Nothing changes on the result, if the lower superlexical prefix is missing like in the perfective Russian example *po-vy-talk-iva-t'* 'to push out one after another' from section 1.2. The distributive *po-*, with its perfective aspect feature, spells out the higher SP in (76) and it is again the closest element to the aspectual head.

In contrast, if the only superlexical prefix merges in the lower SP position like in the Czech predicate *do-plét-a-t* 'to complete knitting' in (17b), the imperfective feature of the imperfectivizing suffix will be the closest aspect feature to Asp. Consequently, the imperfective operator will be used for the aspectual head.

It is obvious from the discussion that there can be aspectual markers with valued, uninterpretable aspect features that do not enter into an Agree relation. To cope with this issue, I assume that for the semantic interface, only unvalued features (but not uninterpretable features) are offending. Concretely, the uninterpretable property of a feature just signals that the feature should not be interpreted at the semantic interface (cf. Zeijlstra 2009). In other words, the interpretable versus uninterpretable property can indicate where (i.e. which occurrence of) the feature should be interpreted in the structure.

In the case of predicates containing a lexical prefix and the imperfectivizing suffix like the Russian *za-rabat-yva-t'* ‘to earn’ in (9b) and the Czech *vy-proš-ova-t* ‘to beg’ in (16b), we also receive the imperfective aspect because the mother SI, with its imperfective feature, unambiguously dominates the P element (lexical prefix); consider the structure in (76) again.

If only a lexical prefix attaches to the predicate, as in *na-kle-i-t'* ‘to stick on’ in (1b) and *vy-chov-a-t* ‘to raise’ in (2b), the aspectual head probes the whole way down in the complex Voice head and finally finds the only available aspect feature on P. This brings about the perfective interpretation. Obviously, the same result is obtained if a superlexical prefix is added to the lexical one, as in the Russian *pere-vy-poln-i-t'* ‘to overfulfill’ in (7a) and the Czech *pře-vy-chov-a-t* ‘to re-educate’ in (8a). Here, however, it is the perfective feature of the superlexical prefix that values the aspectual head.

Since lexical prefixes merge in the complement of the root and then adjoin to it, it must be the root that projects its features in the complex verbal head. From this and the fact that lexical prefixes perfectivize the base predicate, it follows that the root cannot have an imperfective aspect feature. For this reason, I assume that the morphological aspect of simplex verbs is derived by a default mechanism. Specifically, if the probing aspectual head does not find an aspect feature in its c-command domain, it will receive the imperfective aspect value when it is sent to the interfaces (see Preminger 2014 for the claim that the operation Agree can fail). Note that this proposal is in line with the standard approach to Slavic aspect, which takes imperfectivity to be the default aspect value (see e.g. Jakobson 1932, 1984, Comrie 1976, Nübler *et al.* 2017). As to the root of the exceptional perfective simplex predicates like the Russian and Czech *kupit'/koupit* ‘to buy’ and *dat'/dát* ‘to give’, it bears a perfective feature, which is found by the probing aspectual head.

With respect to the semelfactive marker, it was shown in section 1.3 that the suffix combines with prefixes but does not co-occur with the secondary imperfective suffix and the habitual marker. Given that the semelfactive marker also bears an aspect feature and spells out the verbalizing head *v*, its perfective feature will value the aspect feature of Asp in the case of lexically prefixed predicates like the Russian *vs-krik-nu-t'* ‘to give a scream’ in (34) and, of course, in the case of unprefixed semelfactive verbs like *krik-nu-t'* ‘to shout out’ in (23b), which were discussed in section 1.3.

On the contrary, in the case of superlexically prefixed semelfactive verbs like the Czech *na-prask-nou-t* ‘to crack partially’ in (35), it will be the perfective feature of the superlexical prefix that values the aspectual head (independently of whether it is a lower or a higher superlexical prefix) since any SP projected by a superlexical prefix always dominates *v*.

As discussed in sections 1.3 and 1.4, Russian and Czech stem nominalizations differ in the complexity of their structure, specifically, in the presence or absence of higher superlexical prefixes and the aspectual projection. In the case of Czech *-ní* nominals – which can contain higher superlexicals and have the morphological aspect – the morphological aspect value on the aspectual head will be derived as described above. In the case of Russian *-nie* nominals there is no Agree operation because they are aspectless and include the projection with the imperfectivizing marker at the most, plus the projection with the suffix *-n-/-t-* and the nominalizing projection *nP*. Here, the assumption that the uninterpretability of features just signals whether or not the appropriate (instance of the) feature should be interpreted at the semantic interface is applicable. This reasoning applies to all forms that lack the aspectual projection but contain an aspectual marker with an aspect feature, e.g. to the root nominalizations discussed in 1.3, which can include a lexical prefix.

The proposal in (76) derives the correct order for all morphemes except superlexical prefixes. Given that prefixes display a peculiar behavior more generally, I assume that they also have weak prosodic properties which force them to linearize to the left (see e.g. Caha & Ziková 2016, who argue for a proclitic character of short verbal prefixes in Czech, and Biskup, Putnam & Smith 2011, who discuss differences between prefixed verbs and particle

verbs in German and argue that in prefixed verbs the prepositional phonological word is weak in contrast to particle verbs).

## Conclusions

I have argued that the four aspectual morphemes (prefixes, the secondary imperfective suffix, the semelfactive marker and the habitual suffix) are not exponents of the morphological aspect in Russian and Czech; they just work as a trigger of the corresponding aspectual interpretation. However, this is not to say that the aspectual markers are meaningless. They have their own meaning, which can be inner aspectual, as proposed e.g. for the semelfactive suffix in section 1.3. I have shown that the morphological aspect value is determined by the last attached aspectual marker. The aspect value, I have derived by means of the operation Agree, using the concept of closeness based on dominance relations in the moved verbal head. The last attached aspectual marker is the closest element with a valued aspect feature.
